# Propositions

A proposition is a statement that is either true or false such as the following:

- Leslie is a teacher.
- Leslie is rich.
- 🌻 Leslie is a pop singer.
- Simplest (atomic) propositions may be combined to form compound propositions:
  - Leslie is not a teacher.
  - *Either* Leslie is not a teacher *or* Leslie is not rich.
  - If Leslie is a pop singer, then Leslie is rich.

Yih-Kuen Tsay (SVVRL @ IM.NTU)

## Inferences

- We are given the following assumptions:
  - Leslie is a teacher.
  - Either Leslie is not a teacher or Leslie is not rich.
  - If Leslie is a pop singer, then Leslie is rich.
- We wish to conclude the following:
  - Leslie is not a pop singer.
- The above process is an example of *inference* (deduction). Is it correct?

# **Symbolic Propositions**

Propositions are represented by symbols, when only their truth values are of concern.

- P: Leslie is a teacher.
- 🟓 📿: Leslie is rich.
- *R*: Leslie is a pop singer.

Sompound propositions can then be more succinctly written.

- not P: Leslie is not a teacher.
- not P or not Q: Either Leslie is not a teacher or Leslie is not rich.
- \* *R implies Q*: If Leslie is a pop singer, then Leslie is rich.

Yih-Kuen Tsay (SVVRL @ IM.NTU)

## **Symbolic Inferences**

• We are given the following assumptions:

- P (Leslie is a teacher.)
- not P or not Q (Either Leslie is not a teacher or Leslie is not rich.)
- $\circledast$  *R* implies *Q* (If Leslie is a pop singer, then Leslie is rich.)
- We wish to conclude the following:
  - *not R* (Leslie is not a pop singer.)

Correctness of the inference may be checked by asking:

- Is (P and (not P or not Q) and (R implies Q)) implies (not R) a tautology (valid formula)?
- Or, is (A and (not A or not B) and (C implies B)) implies (not C) a tautology (valid formula)?

Yih-Kuen Tsay (SVVRL @ IM.NTU)

# **Propositional Logic: Syntax**

#### S Vocabulary:

- A countable set  $\mathcal{P}$  of *proposition symbols* (variables):  $P, Q, R, \dots$  (also called *atomic propositions*);
- Logical connectives (operators): ¬, ∧, ∨, →, and ↔ and sometimes the constant ⊥ (false);
- 🌻 Auxiliary symbols: "(", ")".
- How to read the logical connectives.
  - 🌻 ¬ (negation): not
  - 🏓 \land (conjunction): and
  - 鯵 🗸 (disjunction): or
  - $\circledast \rightarrow$  (implication): implies (or if ..., then ...)
  - $e \leftrightarrow$  (equivalence): is equivalent to (or if and only if)
  - $ightarrow \perp$  (*false* or bottom): false (or bottom)

Propositional Logic: Syntax (cont.)

#### 📀 Propositional Formulae:

- Any A ∈ P is a formula and so is ⊥ (these are the "atomic" formula).
- If A and B are formulae, then so are ¬A, (A ∧ B), (A ∨ B), (A → B), and (A ↔ B).
- A is called a *subformula* of  $\neg A$ , and A and B subformulae of  $(A \land B)$ ,  $(A \lor B)$ ,  $(A \to B)$ , and  $(A \leftrightarrow B)$ .

Precedence (for avoiding excessive parentheses):

$$A \land B \to C$$
 means  $((A \land B) \to C)$ .

$$\stackrel{\hspace{0.1em}\mathsf{\scriptscriptstyle\$}}{=} A \to B \lor C \text{ means } (A \to (B \lor C)).$$

🌻 More about this later ...

Yih-Kuen Tsay (SVVRL @ IM.NTU)

## **About Boolean Expressions**

 Boolean expressions are essentially propositional formulae, though they may allow more things as atomic formulae.
 Boolean expressions:

Solution Propositional formula:  $(P \lor Q \lor \neg R) \land (\neg P \lor \neg Q) \land P$ 

Yih-Kuen Tsay (SVVRL @ IM.NTU)

FLOLAC 2011 9 / 64

イロト イヨト イヨト イヨト

# **Propositional Logic: Semantics**

The meanings of propositional formulae may be conveniently summarized by the truth table:

A	В	$\neg A$	$A \wedge B$	$A \lor B$	$A \rightarrow B$	$A \leftrightarrow B$
T	T	F	Т	Т	Т	Т
T	F	F	F	Т	F	F
F	T	Т	F	Т	Т	F
F	F	Т	F	F	Т	Т

The meaning of  $\perp$  is always *F* (false).

There is an implicit inductive definition in the table. We shall try to make this precise.

Yih-Kuen Tsay (SVVRL @ IM.NTU)

FLOLAC 2011 10 / 64

(日) (周) (三) (三)

# **Truth Assignment and Valuation**

- The semantics of propositional logic assigns a truth function to each propositional formula.
- Solution Let BOOL be the set of truth values  $\{T, F\}$ .
- A truth assignment (valuation) is a function from P (the set of proposition symbols) to BOOL.
- S Let *PROPS* be the set of all propositional formulae.
- A truth assignment v may be extended to a valuation function v from PROPS to BOOL as follows:

イロト 不得下 イヨト イヨト 二日

# Truth Assignment and Valuation (cont.)

$$\begin{array}{lll} \hat{v}(\bot) &=& F\\ \hat{v}(P) &=& v(P) \ \ \text{for all} \ P \in \mathcal{P}\\ \hat{v}(P) &=& \text{as defined by the table below, otherwise} \end{array}$$

$\hat{v}(A)$	$\hat{v}(B)$	$\hat{v}(\neg A)$	$\hat{v}(A \wedge B)$	$\hat{v}(A \lor B)$	$\hat{v}(A \rightarrow B)$	$\hat{v}(A \leftrightarrow B)$
T	Т	F	Т	Т	Т	Т
T	F	F	F	Т	F	F
F	T	Т	F	Т	Т	F
F	F	Т	F	F	Т	Т

So, the truth value of a propositional formula is completely determined by the truth values of its subformulae.

Yih-Kuen Tsay (SVVRL @ IM.NTU)

Elementary Logic

FLOLAC 2011 12 / 64

(日) (周) (三) (三)

## **Truth Assignment and Satisfaction**

- We say  $v \models A$  (v satisfies A) if  $\hat{v}(A) = T$ .
- So, the symbol |= denotes a binary relation, called satisfaction, between truth assignments and propositional formulae.
- $v \not\models A (v \text{ falsifies } A) \text{ if } \hat{v}(A) = F.$

Yih-Kuen Tsay (SVVRL @ IM.NTU)

Elementary Logic

FLOLAC 2011 13 / 64

イロト 不得下 イヨト イヨト 二日

## Satisfaction

◆ Alternatively (in a more generally applicable format), the satisfaction relation ⊨ may be defined as follows:

$$v \not\models \bot$$
  

$$v \models P \quad \iff \quad v(P) = T, \quad \text{for all } P \in \mathcal{P}$$
  

$$v \models \neg A \quad \iff \quad v \not\models A \text{ (it is not the case that } v \models A)$$
  

$$v \models A \land B \quad \iff \quad v \models A \text{ and } v \models B$$
  

$$v \models A \lor B \quad \iff \quad v \models A \text{ or } v \models B$$
  

$$v \models A \rightarrow B \quad \iff \quad v \not\models A \text{ or } v \models B$$
  

$$v \models A \leftrightarrow B \quad \iff \quad (v \models A \text{ and } v \models B)$$
  

$$or \ (v \not\models A \text{ and } v \not\models B)$$

Yih-Kuen Tsay (SVVRL @ IM.NTU)

FLOLAC 2011 14 / 64

イロト 不得下 イヨト イヨト 二日

- The language that we study is referred to as the *object* language.
- The language that we use to study the object language is referred to as the *meta* language.
- For example, not, and, and or that we used to define the satisfaction relation ⊨ are part of the meta language.

(日) (周) (三) (三)

# Satisfiability

• A proposition A is *satisfiable* if there exists an assignment v such that  $v \models A$ .

$$\stackrel{\hspace{0.1em} \bullet}{=} v(P) = F, v(Q) = T \models (P \lor Q) \land (\neg P \lor \neg Q)$$

- A proposition is unsatisfiable if no assignment satisfies it.
   ∴
    $(\neg P \lor Q) \land (\neg P \lor \neg Q) \land P$  is unsatisfiable.
- The problem of determining whether a given proposition is satisfiable is called the *satisfiability problem*.

イロト 不得下 イヨト イヨト 二日

# **Tautology and Validity**

A proposition A is a *tautology* if every assignment satisfies A, written as \= A.

$$\models A \lor \neg A$$

$$\stackrel{\hspace{0.1em}\mathsf{\scriptscriptstyle\$}}{=} (A \land B) \to (A \lor B)$$

- The problem of determining whether a given proposition is a tautology is called the *tautology problem*.
- A proposition is also said to be *valid* if it is a tautology.
- So, the problem of determining whether a given proposition is valid (a tautology) is also called the *validity problem*.

Note: the notion of a tautology is restricted to propositional logic. In first-order logic, we also speak of valid formulae.

Yih-Kuen Tsay (SVVRL @ IM.NTU)

# Validity vs. Satisfiability

#### Theorem

A proposition A is valid (a tautology) if and only if  $\neg A$  is unsatisfiable.

So, there are two ways of proving that a proposition A is a tautology:

- A is satisfied by every truth assignment (or A cannot be falsified by any truth assignment).
- 📀 ¬A is unsatisfiable.

Yih-Kuen Tsay (SVVRL @ IM.NTU)

(日) (周) (三) (三)

# **Relating the Logical Connectives**

#### Lemma

$$\models (A \leftrightarrow B) \leftrightarrow ((A \rightarrow B) \land (B \rightarrow A))$$
$$\models (A \rightarrow B) \leftrightarrow (\neg A \lor B)$$
$$\models (A \lor B) \leftrightarrow \neg (\neg A \land \neg B)$$
$$\models \bot \leftrightarrow (A \land \neg A)$$

Note: these equivalences imply that some connectives could be dispensed with. We normally want a smaller set of connectives when analyzing properties of the logic and a larger set when actually using the logic.

Yih-Kuen Tsay (SVVRL @ IM.NTU)

Elementary Logic

FLOLAC 2011 19 / 64

イロト イポト イヨト イヨト

# **Normal Forms**

- A *literal* is an atomic proposition or its negation.
- A propositional formula is in Conjunctive Normal Form (CNF) if it is a conjunction of disjunctions of literals.

$$\stackrel{\scriptstyle \bullet}{=} (P \lor Q \lor \neg R) \land (\neg P \lor \neg Q) \land P$$

$$\stackrel{\flat}{=} (P \lor Q \lor \neg R) \land (\neg P \lor \neg Q \lor R) \land (P \lor \neg Q \lor \neg R)$$

A propositional formula is in Disjunctive Normal Form (DNF) if it is a disjunction of conjunctions of literals.

$$\begin{array}{l} \bullet \\ \bullet \\ \bullet \end{array} (P \land Q \land \neg R) \lor (\neg P \land \neg Q) \lor P \\ \bullet \\ \bullet \\ (\neg P \land \neg Q \land R) \lor (P \land Q \land \neg R) \lor (\neg P \land Q \land R) \\ \end{array}$$

- A propositional formula is in Negation Normal Form (NNF) if negations occur only in literals.
  - CNF or DNF is also NNF (but not vice versa).
  - ♦  $(P \land \neg Q) \land (P \lor (Q \land \neg R))$  in NNF, but not CNF or DNF.

Every propositional formula has an equivalent formula in each of these normal forms.

Yih-Kuen Tsay (SVVRL @ IM.NTU)

## **Semantic Entailment**

- $\ref{eq: Second States}$  Consider two sets of propositions  $\Gamma$  and  $\Delta$ .
- We say that v ⊨ Γ (v satisfies Γ) if v ⊨ B for every B ∈ Γ; analogously for Δ.
- We say that Δ is a semantic consequence of Γ if every assignment that satisfies Γ also satisfies Δ, written as Γ ⊨ Δ.

• We also say that  $\Gamma$  *semantically entails*  $\Delta$  when  $\Gamma \models \Delta$ .

Yih-Kuen Tsay (SVVRL @ IM.NTU)

Elementary Logic

FLOLAC 2011 21 / 64

イロト 不得下 イヨト イヨト 二日

## Sequents

- A (propositional) sequent is an expression of the form  $\Gamma \vdash \Delta$ , where  $\Gamma = A_1, A_2, \dots, A_m$  and  $\Delta = B_1, B_2, \dots, B_n$  are finite (possibly empty) sequences of (propositional) formulae.
- In a sequent Γ ⊢ Δ, Γ is called the antecedent (also context) and Δ the consequent.

Note: many authors prefer to write a sequent as  $\Gamma \longrightarrow \Delta$  or  $\Gamma \Longrightarrow \Delta$ , while reserving the symbol  $\vdash$  for provability (deducibility) in the proof (deduction) system under consideration.

# Sequents (cont.)

• A sequent  $A_1, A_2, \dots, A_m \vdash B_1, B_2, \dots, B_n$  is falsifiable if there exists a valuation v such that  $\mathbf{v} \models (A_1 \land A_2 \land \cdots \land A_m) \land (\neg B_1 \land \neg B_2 \land \cdots \land \neg B_n).$  $\circledast$   $A \lor B \vdash B$  is falsifiable. as  $v(A) = T, v(B) = F \models (A \lor B) \land \neg B.$ • A sequent  $A_1, A_2, \cdots, A_m \vdash B_1, B_2, \cdots, B_n$  is valid if, for every valuation v,  $v \models A_1 \land A_2 \land \cdots \land A_m \to B_1 \lor B_2 \lor \cdots \lor B_n$ .  $A \vdash A, B$  is valid.  $\circledast$  A, B  $\vdash$  A  $\land$  B is valid. 😚 A sequent is valid if and only if it is not falsifiable. In the following, we will use only sequents of this simpler form:  $A_1, A_2, \cdots, A_m \vdash C$ , where C is a formula.

Yih-Kuen Tsay (SVVRL @ IM.NTU)

FLOLAC 2011 23 / 64

- Inference rules allow one to obtain true statements from other true statements.
- Below is an inference rule for conjunction.

$$\frac{\Gamma \vdash A \quad \Gamma \vdash B}{\Gamma \vdash A \land B} (\land I)$$

In an inference rule, the upper sequents (above the horizontal line) are called the *premises* and the lower sequent is called the *conclusion*.

# **Proofs**

A deduction tree is a tree where each node is labeled with a sequent such that, for every internal (non-leaf) node,

the label of the node corresponds to the conclusion and

the labels of its children correspond to the premises

of an instance of an inference rule.

- A proof tree is a deduction tree, each of whose leaves is labeled with an axiom.
- The root of a deduction or proof tree is called the conclusion.
- A sequent is provable if there exists a proof tree of which it is the conclusion.

(日) (四) (日) (日) (日)

## **Detour: Another Style of Proofs**

Proofs may also be carried out in a calculational style (like in algebra); for example,

$$(A \lor B) \rightarrow C$$

$$\equiv \{A \rightarrow B \equiv \neg A \lor B\}$$

$$\neg (A \lor B) \lor C$$

$$\equiv \{\text{ de Morgan's law }\}$$

$$(\neg A \land \neg B) \lor C$$

$$\equiv \{\text{ distributive law }\}$$

$$(\neg A \lor C) \land (\neg B \lor C)$$

$$\equiv \{A \rightarrow B \equiv \neg A \lor B\}$$

$$(A \rightarrow C) \land (B \rightarrow C)$$

$$\Rightarrow \{A \land B \Rightarrow A\}$$

$$(A \rightarrow C)$$

Here, ⇒ corresponds to semantical entailment and ≡ to mutual semantical entailment. Both are transitive

Yih-Kuen Tsay (SVVRL @ IM.NTU)

**Elementary Logic** 

FLOLAC 2011 26 / 64

**Detour: Some Laws for Calculational Proofs** 

Equivalence is commutative and associative  $A \leftrightarrow B \equiv B \leftrightarrow A$  $\stackrel{\hspace{0.1cm} \bullet}{=} A \leftrightarrow (B \leftrightarrow C) \equiv (A \leftrightarrow B) \leftrightarrow C$  $\bigcirc | \lor A \equiv A \lor | \equiv A$  $\bigcirc \neg A \land A = \Box$  $A \rightarrow B = \neg A \lor B$  $\bigcirc A \rightarrow | = \neg A$  $(A \lor B) \to C \equiv (A \to C) \land (B \to C)$  $\bigcirc A \land B \Rightarrow A$ 

Yih-Kuen Tsay (SVVRL @ IM.NTU)

Elementary Logic

FLOLAC 2011 27 / 64

Natural Deduction in the Sequent Form

$$\frac{\overline{\Gamma, A \vdash A}}{\Gamma, A \vdash A} (Ax)$$

$$\frac{\overline{\Gamma \vdash A} \quad \overline{\Gamma \vdash B}}{\Gamma \vdash A \land B} (\land I) \qquad \frac{\overline{\Gamma \vdash A \land B}}{\Gamma \vdash A} (\land E_{1})$$

$$\frac{\overline{\Gamma \vdash A \land B}}{\Gamma \vdash B} (\land I_{1})$$

$$\frac{\overline{\Gamma \vdash A}}{\Gamma \vdash A \lor B} (\lor I_{1})$$

$$\frac{\Gamma \vdash A \lor B}{\Gamma \vdash B} (\lor I_{2}) \qquad \frac{\Gamma \vdash A \lor B \quad \Gamma, A \vdash C \quad \Gamma, B \vdash C}{\Gamma \vdash C} (\lor E)$$

## **Predicates**

- A predicate is a "parameterized" statement that, when supplied with actual arguments, is either true or false such as the following:
  - Leslie is a teacher.
  - Chris is a teacher.
  - Leslie is a pop singer.
  - Chris is a pop singer.
- Like propositions, simplest (atomic) predicates may be combined to form compound predicates.

## Inferences

- *For any* person, *either* the person is not a teacher *or* the person is not rich.
- For any person, if the person is a pop singer, then the person is rich.
- We wish to conclude the following:
  - For any person, if the person is a teacher, then the person is not a pop singer.

## **Symbolic Predicates**

Like propositions, predicates are represented by symbols.

- (x): x is a teacher.
- (x): x is rich.
- r(y): y is a pop singer.
- Compound predicates can be expressed:
  - For all  $x, r(x) \rightarrow q(x)$ : For any person, if the person is a pop singer, then the person is rich.
  - For all  $y, p(y) \rightarrow \neg r(y)$ : For any person, if the person is a teacher, then the person is not a pop singer.

Yih-Kuen Tsay (SVVRL @ IM.NTU)

FLOLAC 2011 36 / 64

## **Symbolic Inferences**

We are given the following assumptions:

- $\stackrel{\text{\tiny{$\bullet$}$}}{=} \text{ For all } x, \neg p(x) \lor \neg q(x).$
- For all  $x, r(x) \rightarrow q(x)$ .
- 😚 We wish to conclude the following:

 $\texttt{\bullet} \quad \mathsf{For all } x, p(x) \to \neg r(x).$ 

To check the correctness of the inference above, we ask: Is ((for all x, ¬p(x) ∨ ¬q(x)) ∧ (for all x, r(x) → q(x))) → (for all x, p(x) → ¬r(x)) valid?

Yih-Kuen Tsay (SVVRL @ IM.NTU)

FLOLAC 2011 37 / 64

# First-Order Logic: Syntax

#### Logical symbols:

- A countable set V of variables: x, y, z, ...;
- ★ Logical connectives (operators): ¬, ∧, ∨, →, ↔, ⊥, ∀ (for all), ∃ (there exists);
- 🌻 Auxiliary symbols: "(", ")".
- Non-logical symbols:
  - A countable set of *function symbols* with associated ranks (arities);
  - A countable set of *constants* (which may be seen as functions with rank 0);
  - A countable set of *predicate symbols* with associated ranks (arities);
- ✓ We refer to a first-order language as Language L, where L is the set of non-logical symbols (e.g., {+, 0, 1, <}). The set L is usually referred to as the signature of the first-order language.</p>

Yih-Kuen Tsay (SVVRL @ IM.NTU)

イロト イポト イヨト イヨト 二日

# First-Order Logic: Syntax (cont.)

#### 😚 Terms:

- Every constant and every variable is a term.
- If  $t_1, t_2, \dots, t_k$  are terms and f is a k-ary function symbol (k > 0), then  $f(t_1, t_2, \dots, t_k)$  is a term.

#### 😚 Atomic formulae:

- Every predicate symbol of 0-arity is an atomic formula and so is 1.
- \* If  $t_1, t_2, \dots, t_k$  are terms and p is a k-ary predicate symbol (k > 0), then  $p(t_1, t_2, \dots, t_k)$  is an atomic formula.
- For example, consider Language  $\{+, 0, 1, <\}$ .
  - 0, x, x + 1, x + (x + 1), etc. are terms.
  - ightarrow 0 < 1, x < (x + 1), etc. are atomic formulae.

Yih-Kuen Tsay (SVVRL @ IM.NTU)

First-Order Logic: Syntax (cont.)

😚 Formulae:

- Every atomic formula is a formula.
- If A and B are formulae, then so are  $\neg A$ ,  $(A \land B)$ ,  $(A \lor B)$ ,  $(A \lor B)$ ,  $(A \to B)$ , and  $(A \leftrightarrow B)$ .
- ♦ If x is a variable and A is a formula, then so are  $\forall xA$  and  $\exists xA$ .
- First-order logic with equality includes equality (=) as an additional logical symbol, which behaves like a predicate symbol.
- Second Example formulae in Language  $\{+, 0, 1, <\}$ :

$$\begin{array}{l} \circledast \ (0 < x) \lor (x < 1) \\ \circledast \ \forall x (\exists y (x + y = 0)) \end{array}$$

Yih-Kuen Tsay (SVVRL @ IM.NTU)

FLOLAC 2011 40 / 64

イロト 人間ト イヨト イヨト

First-Order Logic: Syntax (cont.)

IM

We may give the logical connectives different binding powers, or precedences, to avoid excessive parentheses, usually in this order:

$$\neg, \{\forall, \exists\}, \{\wedge, \lor\}, \rightarrow, \leftrightarrow$$

For example,  $(A \land B) \rightarrow C$  becomes  $A \land B \rightarrow C$ .

Common abbreviations:

$$x = y = z$$
 means  $x = y \land y = z$ .

- $p \rightarrow q \rightarrow r$  means  $p \rightarrow (q \rightarrow r)$ . Implication associates to the right, so do other logical symbols.
- $\stackrel{\scriptstyle (\ensuremath{\not{\sc b}}\)}{=} \forall x, y, zA \text{ means } \forall x (\forall y (\forall zA)).$

Yih-Kuen Tsay (SVVRL @ IM.NTU)

FLOLAC 2011 41 / 64

## Free and Bound Variables

- In a formula ∀xA (or ∃xA), the variable x is bound by the quantifier ∀ (or ∃).
- A free variable is one that is not bound.
- The same variable may have both a free and a bound occurrence.
- For example, consider (∀x(R(x, y) → P(x)) ∧ ∀y(¬R(x, y) ∧ ∀xP(x))). The underlined occurrences of x and y are free, while others are bound.
- A formula is *closed*, also called a *sentence*, if it does not contain a free variable.

イロト イポト イヨト イヨト 二日

For a term t, the set FV(t) of free variables of t is defined inductively as follows:

• 
$$FV(x) = \{x\}$$
, for a variable x;

• 
$$FV(c) = \emptyset$$
, for a contant  $c$ ;

•  $FV(f(t_1, t_2, \dots, t_n)) = FV(t_1) \cup FV(t_2) \cup \dots \cup FV(t_n)$ , for an *n*-ary function *f* applied to *n* terms  $t_1, t_2, \dots, t_n$ .

# Free Variables Formally Defined (cont.)

For a formula A, the set FV(A) of free variables of A is defined inductively as follows:

*FV*(*P*(*t*<sub>1</sub>, *t*<sub>2</sub>, ..., *t<sub>n</sub>*)) = *FV*(*t*<sub>1</sub>) ∪ *FV*(*t*<sub>2</sub>) ∪ ... ∪ *FV*(*t<sub>n</sub>*), for an *n*-ary predicate *P* applied to *n* terms *t*<sub>1</sub>, *t*<sub>2</sub>, ..., *t<sub>n</sub>*; *FV*(*t*<sub>1</sub> = *t*<sub>2</sub>) = *FV*(*t*<sub>1</sub>) ∪ *FV*(*t*<sub>2</sub>); *FV*(¬*B*) = *FV*(*B*); *FV*(¬*B*) = *FV*(*B*); *FV*(*B* \* *C*) = *FV*(*B*) ∪ *FV*(*C*), where \* ∈ {∧, ∨, →, ↔}; *FV*(⊥) = Ø; *FV*(∀*xB*) = *FV*(*B*) - {*x*}; *FV*(∃*xB*) = *FV*(*B*) - {*x*}.

# **Bound Variables Formally Defined**

For a formula A, the set BV(A) of bound variables in A is defined inductively as follows:

•  $BV(P(t_1, t_2, \dots, t_n)) = \emptyset$ , for an *n*-ary predicate *P* applied to *n* terms  $t_1, t_2, \dots, t_n$ ;

• 
$$BV(t_1 = t_2) = \emptyset;$$

• 
$$BV(\neg B) = BV(B);$$

$$\red$$
  $BV(B*C)=BV(B)\cup BV(C)$ , where  $*\in\{\wedge,ee,
ightarrow,\leftrightarrow\}$ ;

• 
$$BV(\perp) = \emptyset;$$

$$\ \odot \ BV(\forall xB) = BV(B) \cup \{x\};$$

Yih-Kuen Tsay (SVVRL @ IM.NTU)

## **Substitutions**

- Let t be a term and A a formula.
- The result of substituting t for a free variable x in A is denoted by A[t/x].
- Consider  $A = \forall x (P(x) \rightarrow Q(x, f(y))).$ 
  - When t = g(y),  $A[t/y] = \forall x(P(x) \rightarrow Q(x, f(g(y))))$ .
  - For any t, A[t/x] = ∀x(P(x) → Q(x, f(y))) = A, since there is no free occurrence of x in A.
- A substitution is *admissible* if no free variable of *t* would become bound (be captured by a quantifier) after the substitution.
- For example, when t = g(x, y), A[t/y] is not admissible, as the free variable x of t would become bound.

Yih-Kuen Tsay (SVVRL @ IM.NTU)

FLOLAC 2011 46 / 64

# Substitutions (cont.)

- Suppose we change the bound variable x in A to z and obtain another formula  $A' = \forall z (P(z) \rightarrow Q(z, f(y))).$
- Intuitively, A' and A should be equivalent (under any reasonable semantics). (Technically, the two formulae A and A' are said to be α-equivalent.)
- We can avoid the capture in A[g(x, y)/y] by renaming the bound variable x to z and the result of the substitution then becomes  $A'[g(x, y)/y] = \forall z(P(z) \rightarrow Q(z, f(g(x, y)))).$
- So, in principle, we can make every substitution admissible while preserving the semantics.

Yih-Kuen Tsay (SVVRL @ IM.NTU)

Elementary Logic

・ロト ・四ト ・ヨト ・ヨト ・ヨ

Let s and t be terms. The result of substituting t in s for a variable x, denoted s[t/x], is defined inductively as follows:

# Substitutions Formally Defined (cont.)

For a formula A, A[t/x] is defined inductively as follows:

•  $P(t_1, t_2, \cdots, t_n)[t/x] = P(t_1[t/x], t_2[t/x], \cdots, t_n[t/x])$ , for an *n*-ary predicate *P* applied to *n* terms  $t_1, t_2, \cdots, t_n$ ;

• 
$$(t_1 = t_2)[t/x] = (t_1[t/x] = t_2[t/x]);$$
  
•  $(\neg B)[t/x] = \neg B[t/x];$ 

- $(B * C)[t/x] = (B[t/x] * C[t/x]), \text{ where } * \in \{\land, \lor, \rightarrow, \leftrightarrow\};$
- $I[t/x] = \bot;$
- $(\forall xB)[t/x] = (\forall xB);$
- $(\forall yB)[t/x] = (\forall yB[t/x])$ , if variable y is not x;
- $(\exists xB)[t/x] = (\exists xB);$
- $(\exists yB)[t/x] = (\exists yB[t/x])$ , if variable y is not x;

Yih-Kuen Tsay (SVVRL @ IM.NTU)

# **First-Order Structures**

• A first-order structure  $\mathcal{M}$  is a pair (M, I), where

- *M* (a non-empty set) is the *domain* of the structure, and
- I is the *interpretation function*, that assigns functions and predicates over M to the function and predicate symbols.
- An interpretation may be represented by simply listing the functions and predicates.
- For instance, (Z, {+z, 0z}) is a structure for the language {+,0}. The subscripts are omitted, as (Z, {+,0}), when no confusion may arise.

# Semantics of First-Order Logic

- Since a formula may contain free variables, its truth value depends on the specific values that are assigned to these variables.
- Given a first-order language and a structure  $\mathcal{M} = (M, I)$ , an *assignment* is a function from the set of variables to M.
- The structure  $\mathcal{M}$  along with an assignment s determines the truth value of a formula A, denoted as  $A_{\mathcal{M}}[s]$ .
- For example,  $(x + 0 = x)_{(Z,\{+,0\})}[x := 1]$  evaluates to T.

Yih-Kuen Tsay (SVVRL @ IM.NTU)

FLOLAC 2011 51 / 64

# Semantics of First-Order Logic (cont.)

- We say M, s ⊨ A when A<sub>M</sub>[s] is T (true) and M, s ⊭ A otherwise.
- Alternatively, |= may be defined as follows (propositional part is as in propositional logic):

 $\begin{array}{ll} \mathcal{M},s\models\forall xA & \Longleftrightarrow & \mathcal{M},s[x:=m]\models A \ \text{ for all } m\in M.\\ \mathcal{M},s\models\exists xA & \Longleftrightarrow & \mathcal{M},s[x:=m]\models A \ \text{ for some } m\in M.\\ \text{where } s[x:=m] \ \text{denotes an updated assignment } s' \ \text{from } s \ \text{such } \\ \text{that } s'(y)=s(y) \ \text{for } y\neq x \ \text{and } s'(x)=m. \end{array}$ 

For example,  $(Z, \{+, 0\}), s \models \forall x(x + 0 = x)$  holds, since  $(Z, \{+, 0\}), s[x := m] \models x + 0 = x$  for all  $m \in Z$ .

Yih-Kuen Tsay (SVVRL @ IM.NTU)

FLOLAC 2011 52 / 64

# Satisfiability and Validity

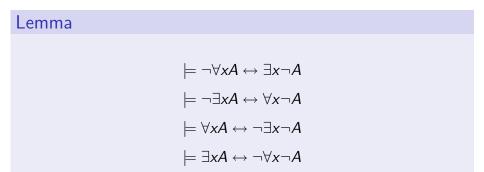

- A formula A is *satisfiable in*  $\mathcal{M}$  if there is an assignment s such that  $\mathcal{M}, s \models A$ .
- A formula A is valid in  $\mathcal{M}$ , denoted  $\mathcal{M} \models A$ , if  $\mathcal{M}, s \models A$  for every assignment s.
- For instance,  $\forall x(x + 0 = x)$  is valid in  $(Z, \{+, 0\})$ .
- $\mathcal{M}$  is called a *model* of A if A is valid in  $\mathcal{M}$ .
- A formula A is *valid* if it is valid in every structure, denoted  $\models A$ .

Yih-Kuen Tsay (SVVRL @ IM.NTU)

FLOLAC 2011 53 / 64

# **Relating the Quantifiers**

Note: These equivalences show that, with the help of negation, either quantifier can be expressed by the other.

Yih-Kuen Tsay (SVVRL @ IM.NTU)

Elementary Logic

FLOLAC 2011 54 / 64

### **Quantifier Rules of Natural Deduction**

$$\frac{\Gamma \vdash A[y/x]}{\Gamma \vdash \forall xA} (\forall I) \qquad \frac{\Gamma \vdash \forall xA}{\Gamma \vdash A[t/x]} (\forall E)$$

$$\frac{\Gamma \vdash A[t/x]}{\Gamma \vdash \exists xA} (\exists I) \qquad \frac{\Gamma \vdash \exists xA \quad \Gamma, A[y/x] \vdash B}{\Gamma \vdash B} (\exists E)$$

In the rules above, we assume that all substitutions are admissible and y does not occur free in  $\Gamma$  or A.

Yih-Kuen Tsay (SVVRL @ IM.NTU)

Elementary Logic

FLOLAC 2011 55 / 64

# A Proof in First-Order ND

Below is a partial proof of the validity of  $\forall x(\neg p(x) \lor \neg q(x)) \land \forall x(r(x) \rightarrow q(x)) \rightarrow \forall x(p(x) \rightarrow \neg r(x))$  in *ND*, where  $\gamma$  denotes  $\forall x(\neg p(x) \lor \neg q(x)) \land \forall x(r(x) \rightarrow q(x))$ .

$$\frac{\overline{\gamma, p(y), r(y) \vdash r(y) \rightarrow q(y)}}{\gamma, p(y), r(y) \vdash q(y)} \xrightarrow{(Ax)} (Ax)$$

$$\frac{\gamma, p(y), r(y) \vdash q(y)}{(\rightarrow E)} \xrightarrow{(Ax)} (Ax)$$

$$\frac{\gamma, p(y), r(y) \vdash q(y)}{(\gamma r(x) \lor q(x)) \land \forall x(r(x) \rightarrow q(x)), p(y) \vdash \gamma r(y)} (Ax)} \xrightarrow{(Ax)} (Ax)$$

$$\frac{\gamma, p(y), r(y) \vdash q(y)}{(\gamma r(x) \lor q(x)) \land \forall x(r(x) \rightarrow q(x)), p(y) \vdash \gamma r(y)} (Ax)} \xrightarrow{(Ax)} (Ax)$$

$$\frac{\gamma, p(y), r(y) \vdash r(y)}{(Ax)} \xrightarrow{(Ax)} (Ax)$$

$$\frac{\gamma, p(y), r(y) \vdash q(y)}{(Ax)} \xrightarrow{(Ax)} (Ax)$$

$$\frac{\gamma, p(y), r(y) \vdash q(y)}{(Ax)} \xrightarrow{(Ax)} (Ax)} \xrightarrow{(Ax)} (Ax)$$

$$\frac{\gamma, p(y), r(y) \vdash q(y)}{(Ax)} \xrightarrow{(Ax)} (Ax)$$

$$\frac{\gamma, p(y), r(y)}{$$

## Theory

- 😚 Assume a fixed first-order language.
- $\bigcirc$  A set S of sentences is closed under provability if

 $S = \{A \mid A \text{ is a sentence and } S \vdash A \text{ is provable}\}.$ 

- A set of sentences is called a *theory* if it is closed under provability.
- A theory is typically represented by a smaller set of sentences, called its axioms.

## Group as a First-Order Theory

- The set of non-logical symbols is {·, e}, where · is a binary function (operation) and e is a constant (the identity).
- 📀 Axioms:

- $\bigcirc$  (Z, {+,0}) and (Q \ {0}, {×,1}) are models of the theory.
- 📀 Additional axiom for Abelian groups:

$$\forall a, b(a \cdot b = b \cdot a)$$
 (Commutativity)

Yih-Kuen Tsay (SVVRL @ IM.NTU)

### Theorems

- A theorem is just a statement (sentence) in a theory (a set of sentences).
- For example, the following are theorems in Group theory:

$$> \forall a \forall b \forall c((a \cdot b = a \cdot c) \rightarrow b = c).$$

∀a∀b∀c(((a·b = e) ∧ (b·a = e) ∧ (a·c = e) ∧ (c·a = e)) → b = c),
 which says that every element has a unique inverse.
